BARRISTER AND ATTORNEY-AT-LAW, and
Solicitor in Chancery, Conveyancer,
Belleville, C.W. 23

THE WAVE LINE OF THE SHIP.
The third day of the trip was very fine.
The "Wave" line of the ship, and its results
are indeed wonderful. She is, as well
known, conceived from the low side, on the
water line, following in some three feet,
and with a narrow curve, but on Mr.
Russell's celebrated wave line which is
better. The result, as may be seen from
the accompanying drawing, is that the
vessel does not rise a perceptible
wave. And at the stern, the surface of the
water is entirely smooth as far as affected
by the movement of the vessel. The pas-
senger, of course, rises following wave of
their own, which by the way has been
discovered by the author of the wave line
to be of constant length, whatever their
height, at given speed, and the length of
which has been calculated by the same
method as the wave line of the ship
may be calculated from them, and is so
calculated by one of our party.
The philosophy of the wave line is
not pretty well known, and is giving
the water the slightest rise impulse
first, and following it up by an increasing
angle, the pressure of the air, added to the
momentum already imparted to the water,

VIEW OF THE STEAMSHIP "GREAT EASTERN."

THE GREAT EASTERN AT NEW YORK.

DETAILS OF HER VOYAGE.

The *Great Eastern* left Southampton on the morning of Sunday, June 17th. The distance run the first day was 235 miles, with 6,000 revolutions of the paddle, and 20,178 revolutions of the screw per minute. The weather on the day of departure was lowering, but on the morning of the 18th was fine.
